

AMENDMENTS TO THE SPECIFICATION

Page 6, amend the first full paragraph to read:

This strip 8 is then pressed together (or compressed) entirely or almost entirely, for example in a direction according to arrow P1 in figure 4, whereby at least a part of the cells in the viscoelastic foam 3 are broken open, such that the foam 3 obtains a more open structure and allows for a good air circulation.

Page 6, amend paragraph 2 to read:

After having pressed together (or compressed) the foam 3 and after it has reassumed its original shape, the strip 8 is bent, as is schematically represented by means of a chain line in figure 5, whereby the side walls 11-12 of the strip 8 are fixed together in order to form the aimed tubular, resilient body 1.
